

INSTALLATION – CONTINUED

1

ELECTRICAL CONNECTION

WARNING: Turn off the power supply.

1. Open the shipping box **[B]** and place it in front of the desired location, as shown at the bottom of the page. Leave the baseboard **[C]** in its box to protect it during installation.
2. Loosen the screw to remove the junction box cover **[D]**. There is one on each side of the baseboard.
3. Carefully pull the two (2) wires **[E]** connected by a connection cap **[F]** until they come out of the junction box.
4. Depending on the type of installation, use one of the two connection diagrams on the next page. Connect the ground wire securely with the green screw **[G]** provided for this purpose.
5. Connect the baseboard wires **[E]** to those of the power supply **[H]**. Tighten the wires securely in connection caps.
6. Push all wires into the junction box. Reposition the access cover then retighten the screw **[D]**, making sure to place the power cable **[H]** in one of the two clearances **[J]**.

Note: If the installation is made in an access cover knockout **[K]**, use a cable clamp to secure the power cable (cable clamp not included).

INSTALLATION AT A CONSTRUCTION SITE: The packaging is designed so that you can make the electrical connection while keeping the baseboard protected in its box. Punch the box **[B]** along the dotted lines **[L]** to access the junction box.
